# STUDENT INSTRUCTIONS

You are about to start playing a simulation game on the global economy. You are going to play the role of a major participant in this simulation on world trade. The game consists of the following players:

| | |
|---|---|
| **G Countries** – | Represent wealthy countries or western countries |
| **LDC Countries** – | Represent Lesser developed Countries (LDCs) or Third World Countries |
| **IMF /WB** – | Represents the major lending institution in the global economy |
| **WTO –** | Regulates trade between countries |
| **LDC Banker** – | Banker for LDC Countries that processes health and education budgets and distributes country revenue and resources (beads) |
| **G Banker** – | Banker for G Countries that processes health and education budgets and distributes country revenue and resources (beads) |

Each country starts the game with $100 Million from the bank. This money is used to engage in trade with other countries. LDC countries are trading red beads and G countries are trading green beads. Income earned from trade will be used to pay for health and education services. While the countries are trading, the WTO will circulate among the countries to ensure that trade is running smoothly.

There will be three rounds of trade. After each round of trade, each country will allocate their income to health and education services in their countries. Each country must spend a *minimum* of $100 million on health and education. This money gets deposited with the bank. Some countries may find that they do not have enough money to pay for their health and education requirements. They will have to borrow from the IMF/WB.
