

## Use of the Venn diagram to do comparison between Era and between rock types for each Ecozone

Use Graphic Organizers to compare Table 1 and Table 2.

Classifying involves organizing elements into groups based on their similarities. One of the critical elements of classifying involves the rules that govern class or category membership.

This exercise is a Teacher-Directed Classification Task. In such a task, students are given the elements to classify and the categories into which the elements should be classified. The focus is on placing items into their appropriate categories and understanding why they belong in those categories.

The Venn diagram provides you with a visual display of the similarities and differences between items. The similarities between elements are listed in the intersections between the circles. The differences are listed in the parts of each circle that do not intersect.

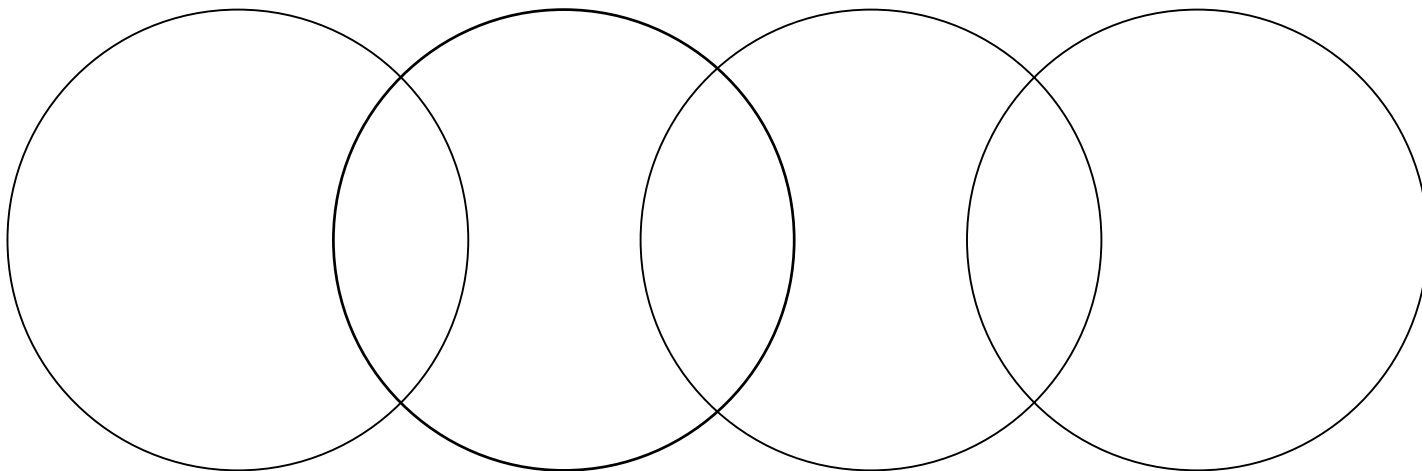

Looking at Table 1, use this Venn diagram to classify the different Ecozones in their most appropriate Era. Look at the highest percentage to make your decision.

**Cenozoic**

**Mesozoic**

**Paleozoic**

**Precambrian**

Summarize below your findings:

**Landforms**

**Era**

---

---

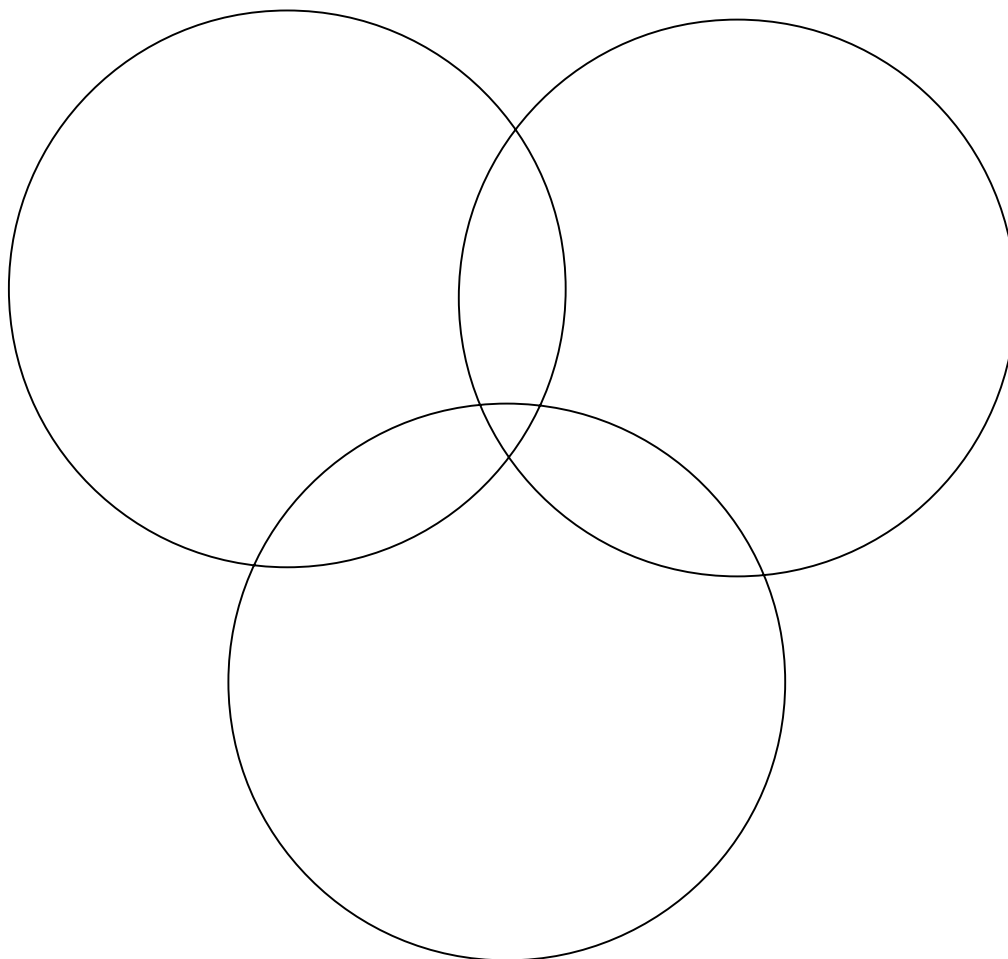

---

Now look at Table 2 and use this Venn diagram to classify the different Ecozones by their most appropriate Rock types. Look at the highest percentage to make your decision.

**Sedimentary Rocks**

**Igneous Rocks**

**Metamorphic Rocks**

Summarize your findings:

**Landforms**

**Era**

**Rock Types**
