

Geological Diversity and Geological History of Canada

Student Activity Sheets

Name: _____

*Most of the answers to these questions can be found in the Geological Diversity and Geological History of Canada background sections.

- 1) Knowing that Precambrian is the oldest rock, which ecozones formed the landmass around which the rest of Canada was formed?

- 2) Which ecozones were the last to be formed?

- 3) From table 1, which ecozones would you estimate to contain the most sedimentary rock?

(Check table 2 to see if you are right)

- 4) Notice that the Arctic Cordillera has 12.86 % unknown, the same amount that was unknown about the Rock Age. Suggest some reasons why this might be the case?

- 5) Does the ecozone with the greatest amount of sedimentary rock agree with your prediction on which area was the youngest geologically?

- 6) Why do the plains contain large amount of sedimentary rock?

7) Why do you think the Taiga Cordillera contains so much sedimentary rock?

Some of the geological information presented is in the context of Ecozones. This map of Ecozones is presented as reference material.
