

Landforms of Canada

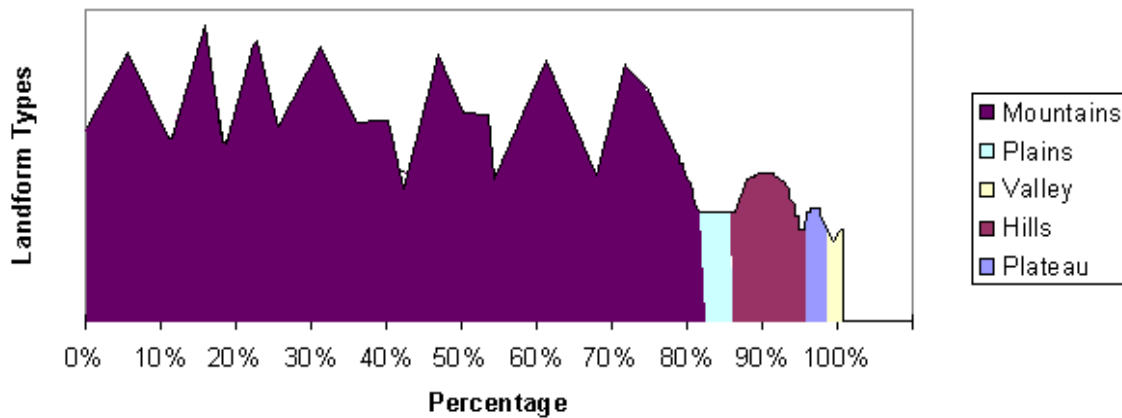

Student Activity Sheets

Name: _____

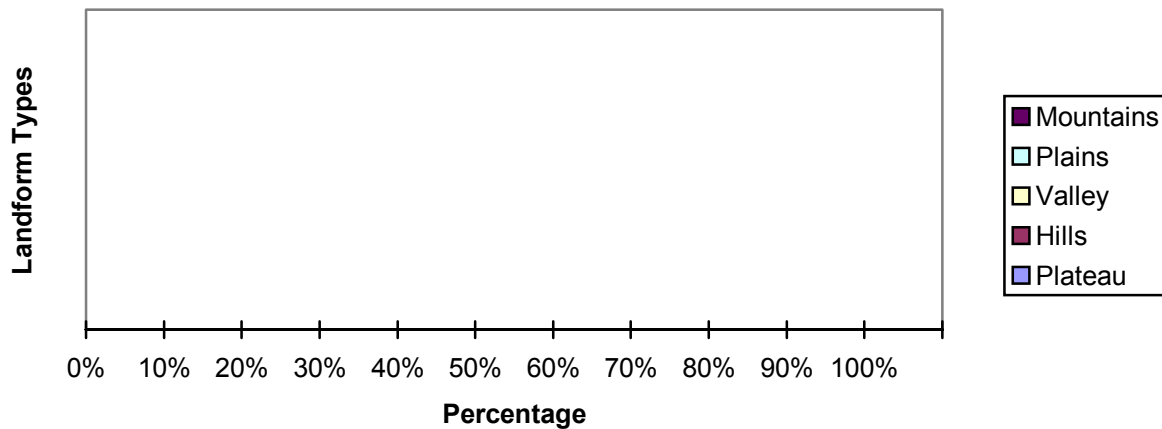

*Most of the answers to these questions can be found in the Landforms of Canada background sections.

- 1) Draw a landform profile for each of the ecozones. Use your own representation of the landforms (ex, broken lines for mountains, etc.) by adding each landform percentage for a total of 100%. Note that these profiles are not accurate since we are not giving you the height of the relief. Compare the similarities and the differences among the profiles and explain how each profile relates to the name of the associated ecozone?

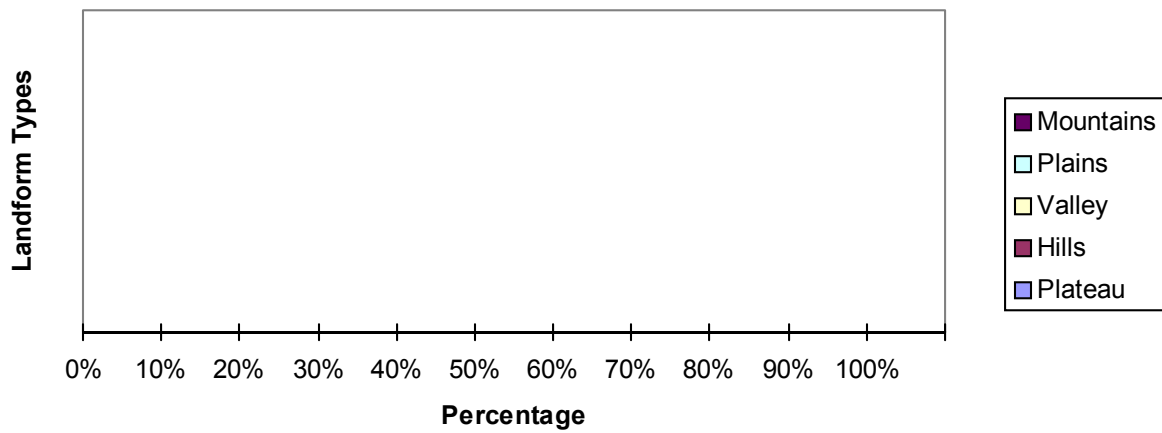

Arctic Cordillera

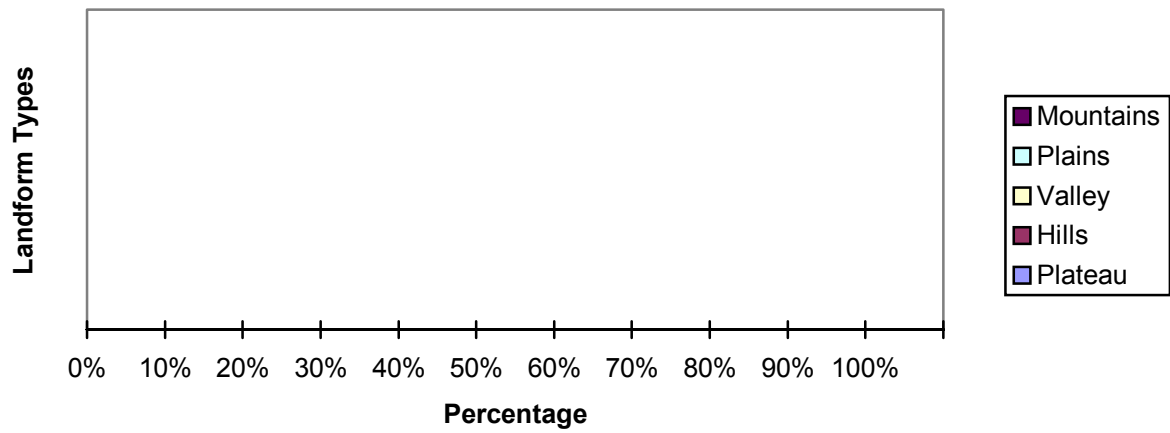

Northern Arctic

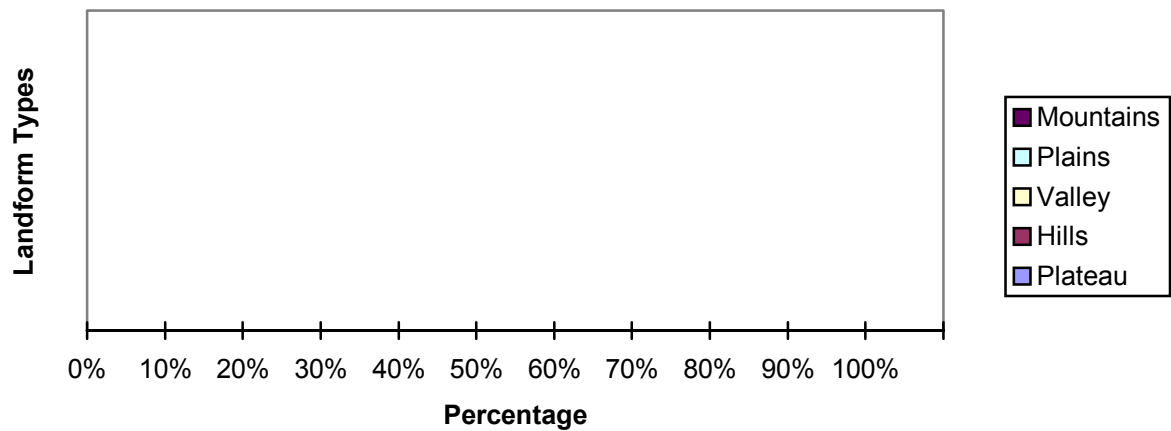

Southern Arctic

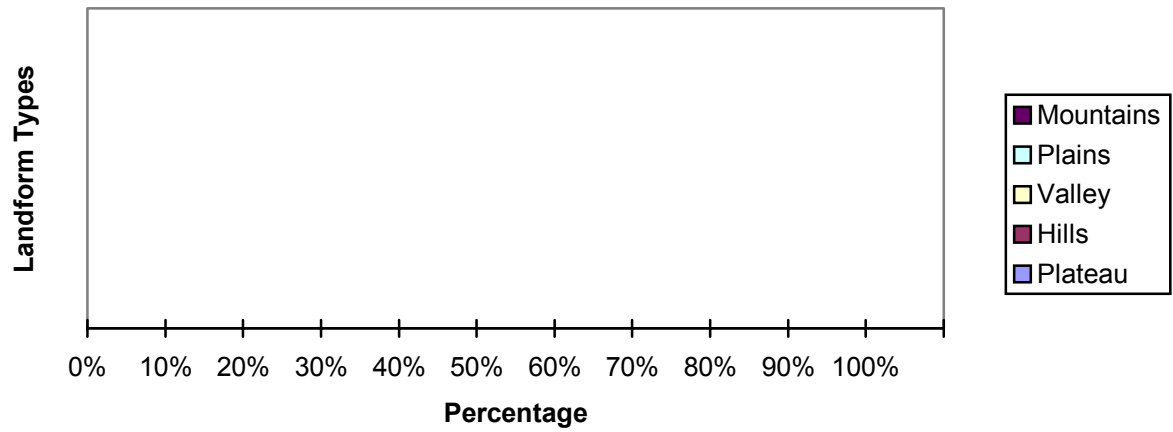

Taiga Plains

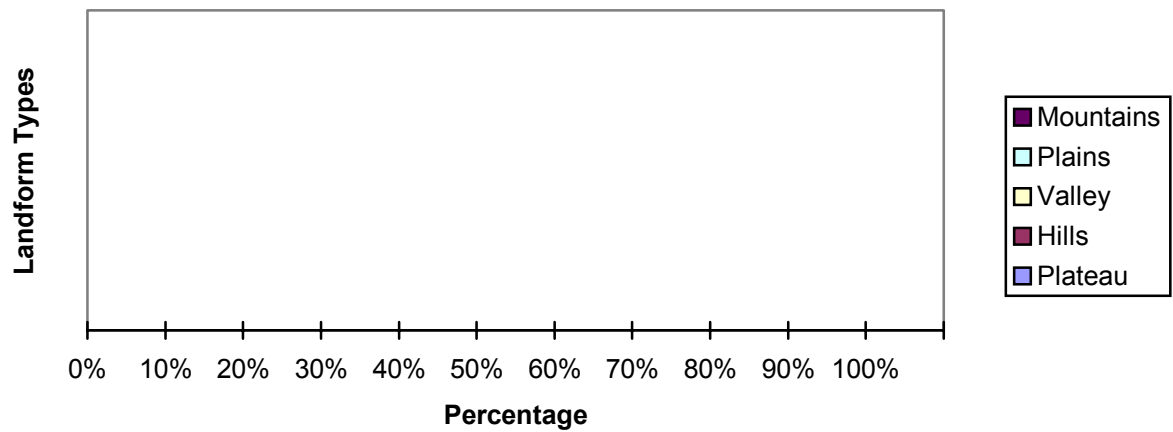

Taiga Shield

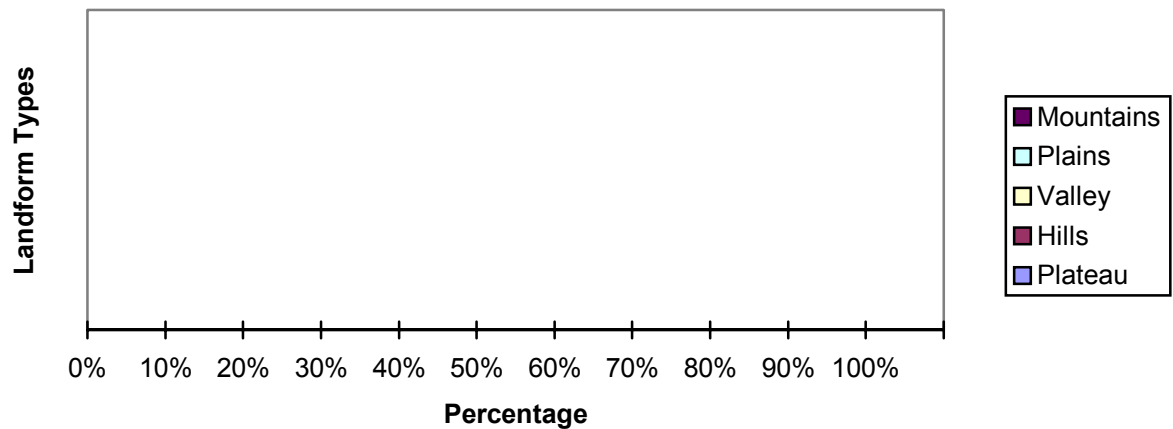

Boreal Shield

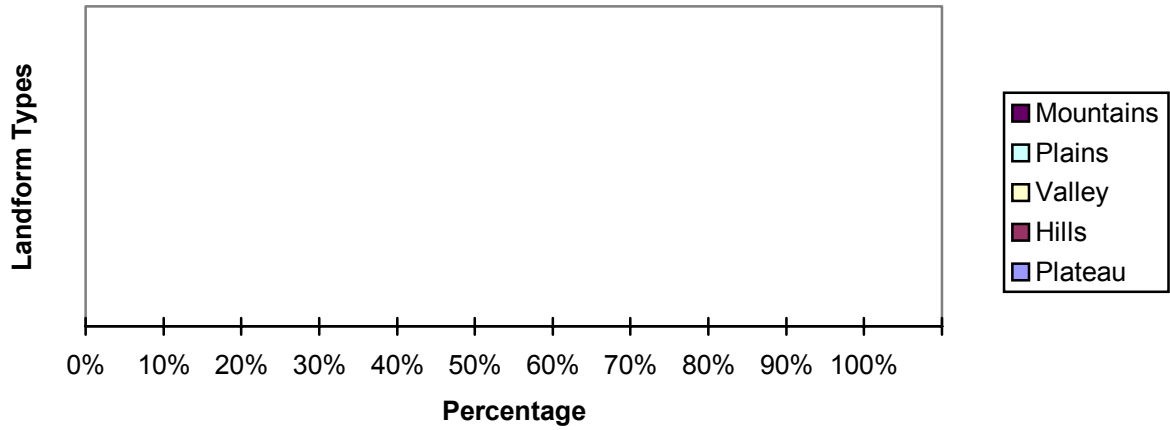

Atlantic Maritime

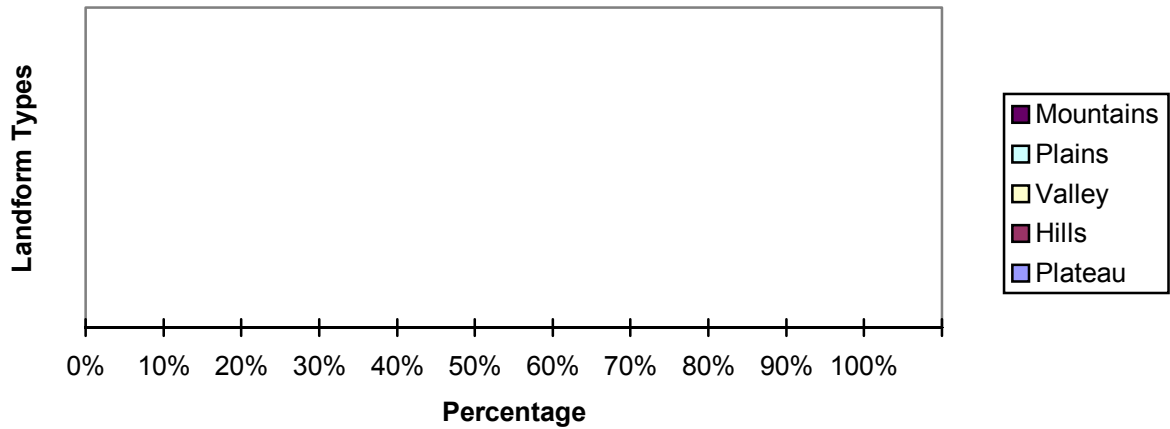

Mixedwood Plains

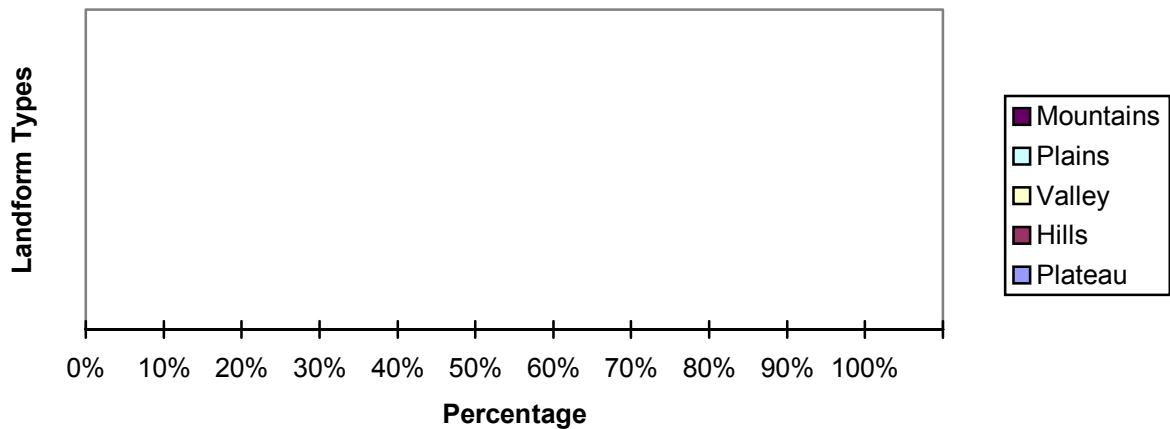

Boreal Plains

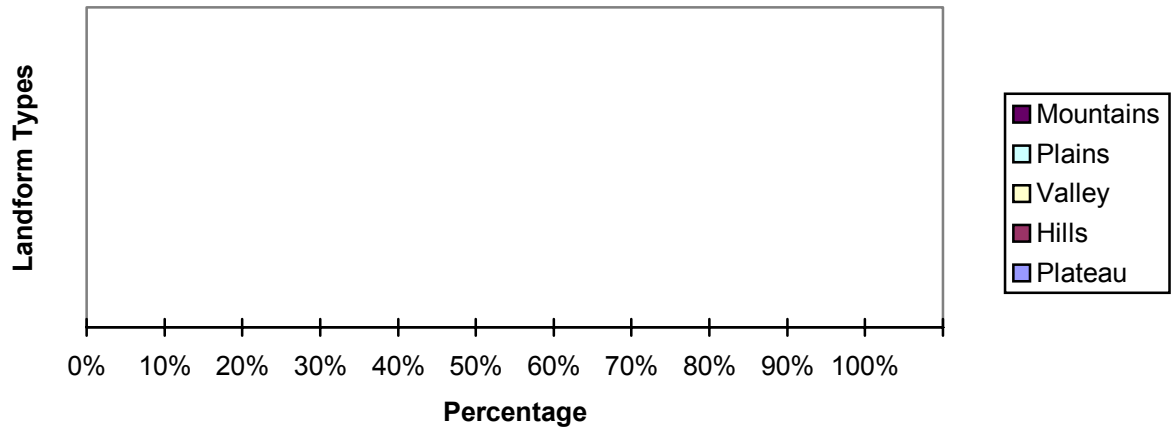

Prairies

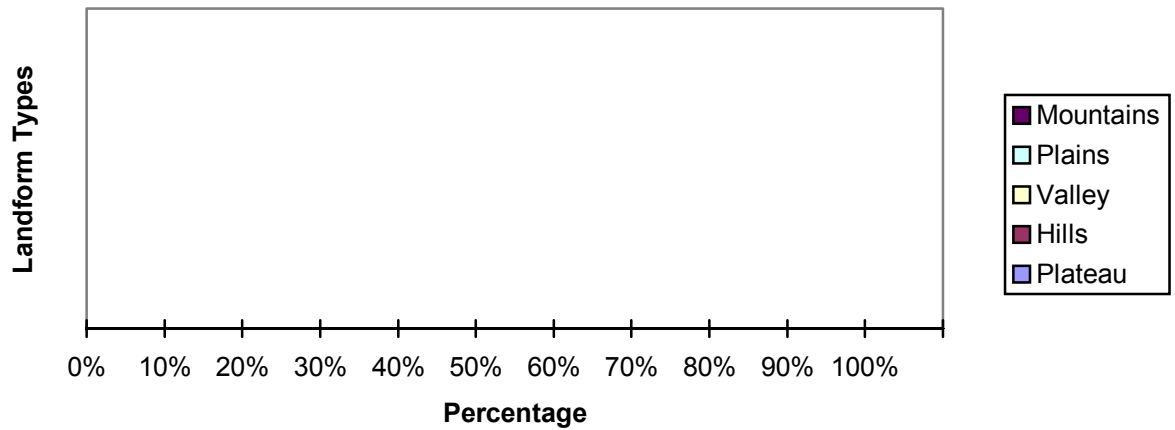

Taiga Cordillera

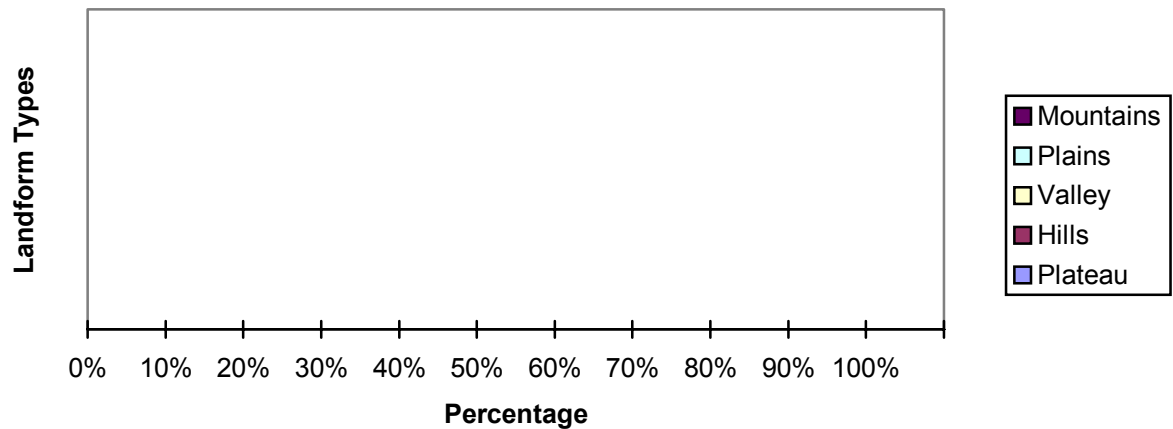

Boreal Cordillera

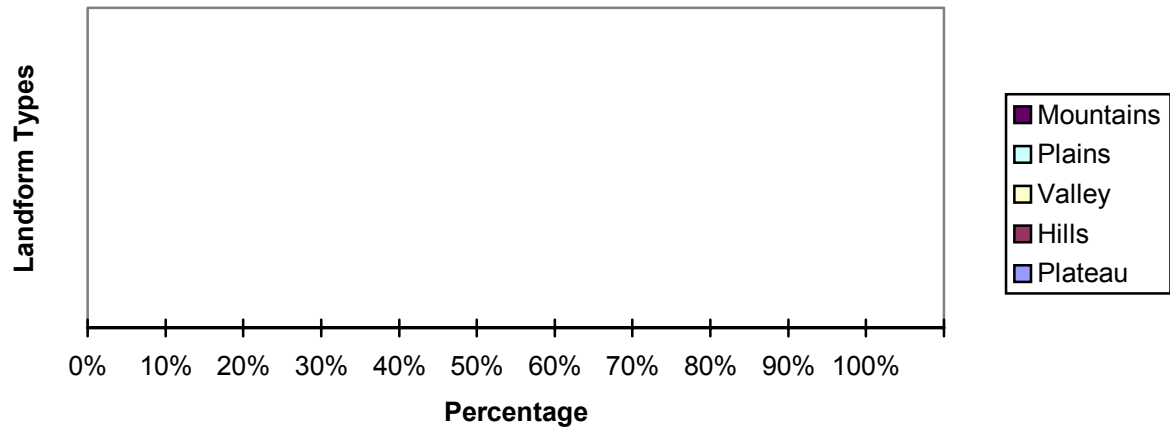

Pacific Maritime

Montane Cordillera

Hudson Plains

Profiles Comments

1. **Arctic Cordillera:**

2. **Northern Arctic:**

3. **Southern Arctic:**

4. **Taiga Plains:**

5. **Taiga Shield:**

6. **Boreal Shield:**

7. **Atlantic Maritime:**

8. **Mixedwood Plains:**

9. **Boreal Plains:**

10. **Prairies:**

11. **Taiga Cordillera:**

12. **Boreal Cordillera:**

13. **Pacific Maritime:**

14. **Montane Cordillera:**

15. **Hudson Plains:**

- 2) Which ecozone has only one landform? _____
- 3) Now considering the changes made from Table 1 to Table 2, how does this rearrangement change the way we see the landscape?
- _____
- _____
- _____
- _____
- 4) Now looking again at Table 2, what does this rearranged table automatically tell us about the ecozones?
- _____
- _____
- _____
- _____
- 5) Which ecozones are the most mountainous?
- _____
- 6) Which ecozones are the flattest?
- _____
- 7) Do you see a relationship between mountains and plateaus?
- _____
- 8) How about hills and plains?
- _____
- 9) Where do you find the greatest amount of valleys? Why?
- _____
- 10) Looking now at Table 3 (Elevation Tables for each ecozone), determine which ecozones have the least elevation difference?
- _____
- 11) Which ecozones have the greatest?
- _____
- 12) Which ecozones are closest to sea level?
- _____
- 13) Using the ecozone map found at the end of this section, draw a line across Canada from west to east just above Canada's border with the USA. Using the mean elevation values from Table 3, draw a graph profile of Canada along this line. As well, graph the mean elevation and the elevation difference as bar graphs on your map.
- 14) What pattern do you see? Where are the highlands? Where are the lowlands?
- _____
- _____
- _____

15) Explain what geological forces caused these highlands to form?

16) Now, looking at Table 5, which surface is most common in Canada?

17) Which ecozone has the most diverse landscape, that is, which has the most evenly divided percentage among the top four surface forms?

18) Create a chart by grouping all the wetland surface forms (bog, fen, marsh, swamp) into one class. Call it "W". Group the rough terrain surface forms together (dissected, inclined, ridged, steep, terraced) called "R" and the flatter terrain surface forms (hummocky, level, rolling, undulating) called "G" together. At this point we will leave "not applicable" as a single group called "P". Graph each ecozone by these four types.

W	B - BOG	F - FEN	M - MARSH	W - SWAMP	
R	D - DISSECTED	I - INCLINED	R - RIDGED	S - STEEP	T - TERRACED
G	H - HUMMOCKY	L - LEVEL	O - ROLLING	U - UNDULATING	
P	# - NOT APPLICABLE				

19) Which ecozone would have the most wetland surface?

20) Which ecozone would be the easiest to traverse?

21) Which would have the steepest inclines?

22) From the following pictures identify the different main surface forms used in this lesson.
