

UNIT 4: THE GLOBAL ECONOMY

Class Time: 75 Minutes

Description

This lesson will emphasize the use of Geomatic data to study several aspects of the global economy, gross domestic product, income disparity, poverty, external debt, and foreign investment.

- Explore the world economy in relation to GDP, poverty, debt, investment and income equity.
- Prepare maps showing GDP, poverty, debt, investment and income equity.
- Analyze world poverty and external debt.
- Use and query data tables linked and associated with maps.
- Compute and use new data tables.
- Display computed data using charts.
- Prepare a map layout for printing.

Curriculum Expectations

Global Economy

Overall Expectations

SSV.02 – analyse the causes and effects of economic disparities around the world.

GCV.01 – demonstrate an understanding of the interdependence of countries in the global economy.

GIV.01 – select and apply geographic skills, methods, and technologies to gather, analyse, and synthesize ideas and information.

GIV.02 – use a variety of methods and technologies to communicate the results of geographic inquiry and analysis effectively.

GIV.03 – select and apply appropriate decision-making and problem-solving strategies to develop solutions for geographic problems and issues.

GIV.04 – conduct an independent inquiry that effectively applies geographic knowledge, skills, methods, and technologies to a selected local, national, or global geographic issue.

Specific Expectations

SS1.04 – identify different methods of grouping countries (e.g., by level of development, economic affiliation) and evaluate the implications of categorizing countries in these ways.

SS1.05 – identify ways in which countries and regions of the world are becoming increasingly interdependent.

SS3.02 – select and compare statistical indicators of quality of life for a variety of developed and developing countries in different parts of the world.

GC3.04 – evaluate factors that may compound problems of hunger and poverty in a selected country.

GI1.02 – demonstrate an understanding of the technologies used in the analysis and synthesis of geographic data (e.g., remote sensing, information technology, geographic information system, hypermedia).

GI2.02 – analyse cause and effect and sequence relationships in geographical data.

GI2.06 – draw conclusions or make judgements or prediction on the basis of reasoned analysis.

GI2.07 – produce mental, thematic, and choropleth maps to illustrate local or global patterns.

GI2.08 – use statistical analysis techniques to interpret and analyse data.

GI2.10 – Use written, oral, and visual communication skills to present the results of geographic inquiry and analysis effectively.

Prior Knowledge and Skills

- Basic knowledge of the ArcView Software (See Power Point Presentation ‘The Basic of ArcView’).
- Awareness of the concepts of international trade and of the global economy (e.g. GDP or gross domestic product, export, import, income disparity, poverty, external debt, and foreign investment).
- Statistical Analysis, Geographical Information System (GIS).

Planning Notes

- You will need a computer system with ArcView GIS software to carry out this unit.
- Download the data from the website <http://www.ocdsb.edu.on.ca/woodsweb/Geomatics> before doing the lesson.
- Photocopy of Worksheet 10 Global Economy.

Teaching/Learning Strategies

Most of the learning strategies are discussed in each activity, but here are some of the overall strategies for the unit.

- Students should do the “Global Economy” lesson with a partner.
- Introduce Arcview to the students with Power Point Presentation “The Basics of Arcview”.
- Make a printout of Worksheet 10: Global Economy and distribute it to every group.
- Introduce the students to the new vocabulary and the new concepts listed in the activity. Refer them to the glossary.
- Explain to the students that they will have to produce a Global Economy World Map, note that their map will be evaluated using the Cartographic Skills and rubric.
- Students will research background information on the global economy.
- Students will download data sets needed for GIS analysis of the global economy (GDP, foreign investment, poverty, income equity, development assistance).
- Students will follow the defined GIS exercise to develop products that provide insight into the current and changing global economy.
- Students will use the GIS output products to answer questions that are imbedded into the exercise.
- Assign students the suggested homework and encourage students to take a more in-dept analysis of the information provided and to research the websites given for this unit.

Accommodations

Frequent monitoring and assistance should be provided. Accommodations that are normally provided in the regular classroom for students with special needs should be provided. Here are some strategies for helping them.

- Information should be presented in as many modalities as possible through oral presentations, board notes, diagrams, class discussions, activity-based learning.

- Instructions should be clear, concise, to the point, verbally rehearsed by the student, properly sequenced, reviewed after a time lapse, written down on the board or in a notebook.
- Assignments should be outlined in writing, written in the students' homework/assignment book, written (and left) on the blackboard, broken down step by step with the teacher, rehearsed/modelled, and scheduled step by step.
- Questioning should be clear, concise, allow appropriate response time. Students need to organise their thoughts, match them with appropriate vocabulary, put them in correct syntax, sequence the ideas and finally express them with good speech. These skills are often taken for granted when teaching new concepts.
- Encourage students to question for clarification and additional information. Learn to speak at a lower rate of speech. Avoid figurative language unless it has been specifically pre-taught. Encourage and evaluate oral responses and class participation. Allow extra time (e.g. homework) for students to complete assignments that other students may finish in class time. Create extra practice opportunities with new vocabulary or concepts. Provide overviews or lesson highlights at the beginning of class. Discuss and simplify sophisticated vocabulary or language. Finally, give several short assignments rather than one long one.
